

MM Tattoo Removal

I have read the recommendations for skin aftercare and the procedure using MM TATTOO REMOVER.

Name _____

Signed _____ Date ____ / _____ / 20 ____

Removal of permanent eyebrow makeup.

1. After the procedure, gently blot the eyebrows with a damp disc with chlorhexidine.
2. Keep the treated area dry for 24 hours after the procedure. If it becomes wet due to the action of leukocytes or through accidental contact with water, gently blot the skin with a cotton swab dipped in chlorhexidine to remove moisture.
3. On the next day after the procedure, you need to blot the crust with a cotton pad soaked in chlorhexidine and dry using a cotton pad. This procedure must be repeated 2 times and be continued for another 5-7 days, 2 times a day, in the morning and in the evening. Keep blotting the crust with a cotton pad dipped in chlorhexidine until the crust completely comes away. Keep the treated area dry.
4. When the brownish crust forms on the treated area of the skin, which naturally disappears after 5-7 days. The treated area should be kept clean, refrain from use of creams, powders, ointments, gels.
5. Do not tear off and pick at the treated area as this will lead to the formation of a scar and prolong the healing period.
6. Do not visit the sauna, solarium and swimming pool. Avoid direct contact with soap or shower water. When washing, use cotton pads, do not get too wet. Do not allow the crust to soften with prolonged exposure to moisture.
7. After the crust has disappeared, redness may be visible on the treated area of the skin, which will be observed on the skin for several weeks.

Immediately after the crusts disappear, it is necessary to actively restore the skin with the help of regenerating and healing creams. Apply the cream twice a day using Scar oil, or Bepanthen Plus, Solcoseryl or Dexpanthenol to reduce skin redness and facilitate the process for 2 weeks. If necessary a further 2 weeks of applying the Contractubex or Enamel cream to prevent scars.

9. It is advised for two weeks clients use a maximum protection sunscreen due to the violation of the integrity of the skin and must be protected from direct sunlight. Pigmentation may occur on the skin if not applied. If the pigment is not completely removed from the treated area, the above procedure can be done again after the treated skin area has healed well (usually after 1-1.5 months).

Re-permanent can be applied to the treated area after the skin has healed well (usually after 1-1.5 months)
