Recommendations for skin care after the procedure
remove MM TATTOO REMOVER.

Removal of permanent makeup of eyelids.

1. Immediately after the procedure, blot the eyelids with a damp disc moistened with chlorhexidine, do not wipe.
2. The area of the skin from which the permanent makeup was removed should remain dry for 24 hours after the procedure. If it becomes wet due to the action of leukocytes or due to accidental contact with water, gently blot the skin with a cotton swab dipped in chlorhexidine to remove moisture.
3. On the evening of the next day after the procedure, you need to blot the crust with a cotton pad soaked in chlorhexidine, immediately with a dry cotton pad. This procedure must be repeated 2 times and continued for another 5-7 days (2 times a day, in the morning and in the evening, blot the crust with a cotton pad moistened with chlorhexidine) until the crust completely falls off. Keep the treated area clean and dry.
4. After a few days, a brownish crust forms on the treated area of the skin, which naturally disappears in 5-7 days. Do not use cosmetics, creams, powders, ointments and gels. Refrain from using chemical peels and exfoliators.
5. Do not tear off and pick the crusts, do not touch the treated area, as this will lead to the formation of a scar and prolong the healing period.
6. Do not visit the sauna, solarium and swimming pool. Avoid direct contact with soap or shower water. When washing, use cotton pads, do not get too wet. Do not allow the crust to soften with prolonged exposure to moisture.
7. After the crust has disappeared, redness may be visible on the treated area of the skin, which will be present on the skin for several weeks (this is considered normal), gradually the skin will return to its normal state. Immediately after the crusts have disappeared, the skin must be actively restored with the help of regenerating and healing creams. You need to apply the cream twice a day with either Bepanthen Plus, Solcoseryl, Dexpanthenol to reduce skin redness and facilitate the process within two weeks. After that if there is further redness then it is advised you continue to apply cream for further 2 weeks to prevent scars. Use Contractubex or Enamel cream.
8. Within two weeks after the crust has disappeared, the skin should be protected from direct sunlight and tanning beds, or use sunscreen with a maximum protection factor. Otherwise, due to a violation of the integrity of the skin, and not due to the effect of the product, pigmentation may occur on the skin.

If the pigment is not completely removed from the treated area, the above procedure can be performed again after the treated skin area has healed (usually after 1-1.5 months).

New permanent makeup can be applied to the treated area after the skin has healed (usually after 1-1.5 months).
